We would like to acknowledge Céline Gieße who implemented the parametrization for the subgrid-scale convection of brine in the MOM model code. The analysis of model results using a brine tracer follows the study by Gieße, C., Meier, H. E. M., Neumann, T. and Moros, M. on “Revisiting the Role of Convective Deep Water Formation in Northern Baltic Sea Bottom Water Renewal” (manuscript under review). The acknowledgements now read:

Acknowledgements. We are very grateful for the assistance of the crew members of the RV *Maria S. Merian*, who made research possible in the sea-ice-covered Baltic Sea. Chief scientist Ralph Schneider always supported our experiments, especially the sea ice coring. Ingo Schuffenhauer operated the CTD and the salinometer. Céline Gieße implemented and tested the parametrization for the subgrid-scale convection of brine in the MOM model code. Computational power was provided by the North-German Supercomputing Alliance (HLRN). We are very grateful for three anonymous referees who helped considerably in improving the manuscript.
