## Supplementary Tables S1 to S8

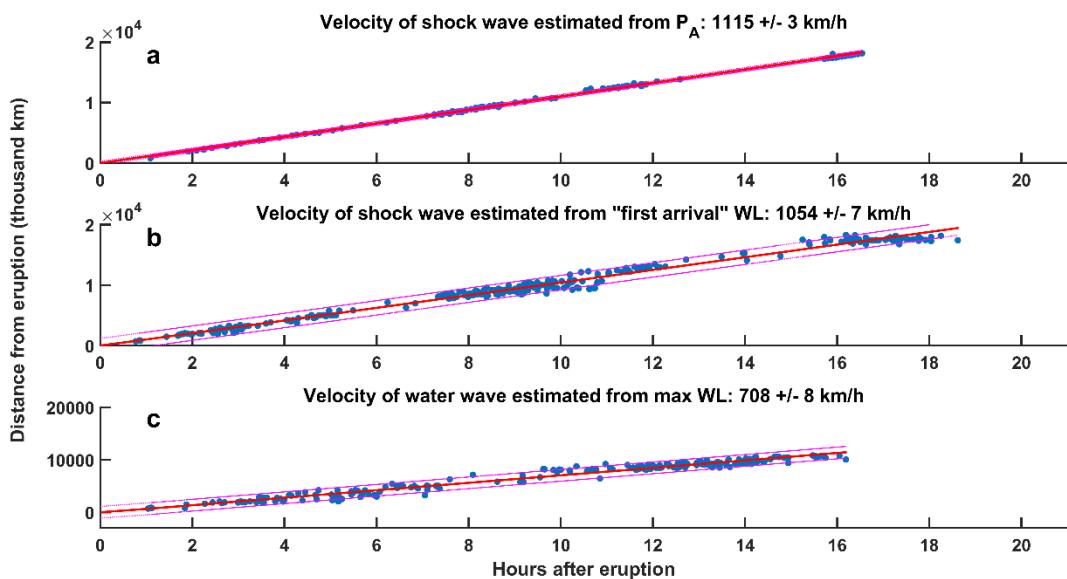

<b>Table S1</b> Stations used for analysis in this study	22
<b>Table S2</b> Air pressure ( $P_A$ ) stations employed.	31
<b>Table S3</b> Inventory of “bad” stations where no tsunami could be clearly observed.	35
<b>Table S4</b> Maximum water level parameters.	51
<b>Table S5</b> First arrival of the VMT estimated from water level records.	59
<b>Table S6</b> Maximum water level parameters.	67
<b>Table S7</b> Maximum VMT-induced WL observed at deep-water buoys.	75
<b>Table S8</b> $\beta$ -factor calculations.	76

63

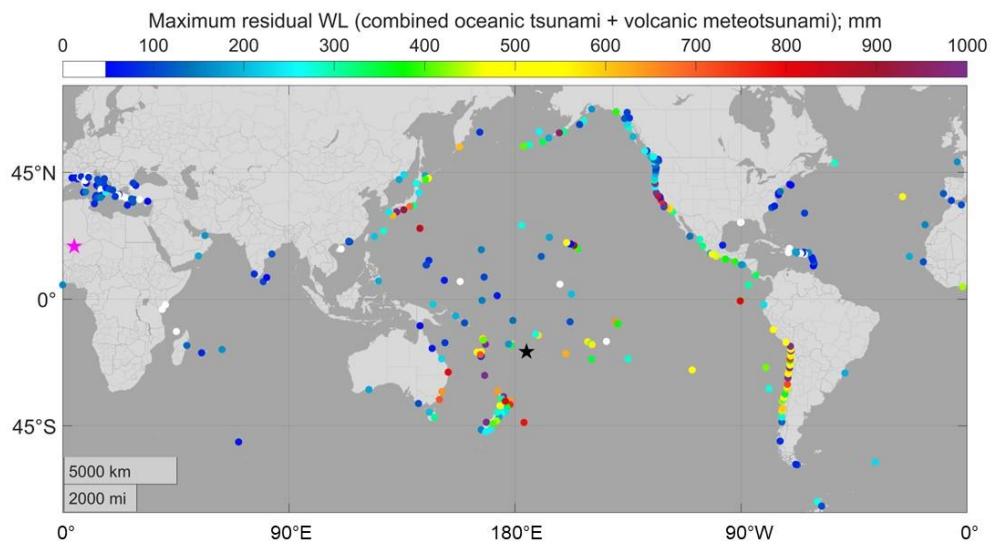

64 **Figure S1** Map inventory of stations where both the VMT and the oceanic tsunami were not  
 65 clearly observed or were too small to analyze. (a) Global results; (b) Expanded view of US East  
 66 Coast; (c) Expanded view of Europe. Status categories and colors are: 1) good data with a small  
 67 signal suggested, but too small to analyze (dark blue); 2) good data but uncertain results, either  
 68 due to too much noise, the presence of storms, or under-sampled data, i.e., 5-min or longer time  
 69 resolution (cyan); 3) instrumental errors (red); 4) missing data (black); and 5) good data, but no  
 70 tsunami signal detected (yellow).

71

72

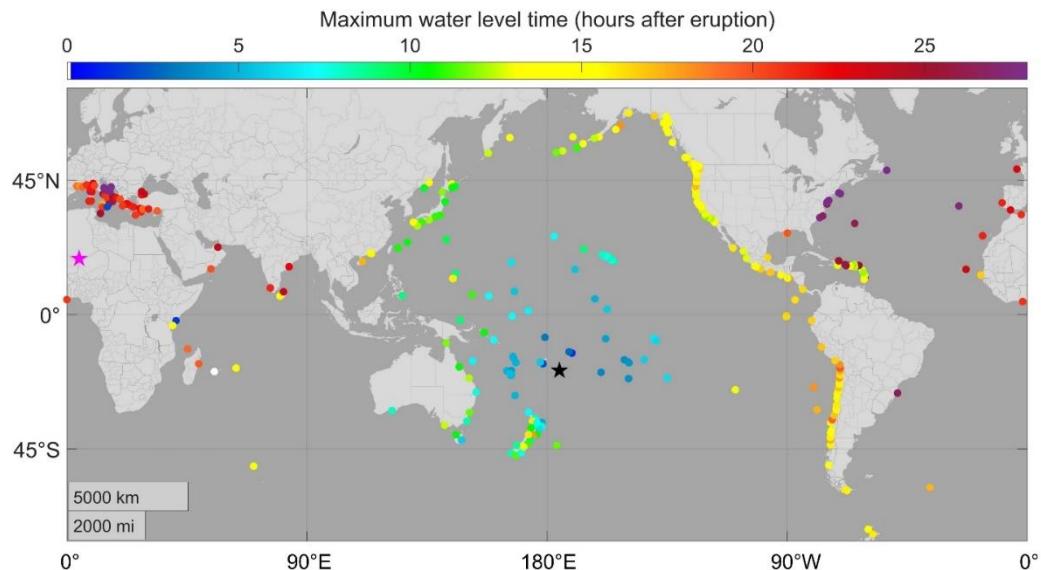

73 **Figure S2** Estimates of different velocity parameters. (a) Shockwave velocity from air pressure  
 74 gauges; (b) Shockwave velocity from tide gauges (estimated from “first arrival” WLs of the  
 75 volcanic meteotsunami); (c) Water wave velocity (estimated from arrival time of oceanic  
 76 tsunami). All scatterplots regress distance (km) from the Tonga volcano vs. time of arrival  
 77 (shockwave or water wave; hours since eruption). Slope values and errors from robust regression  
 78 are given.  
 79

80

81 **Figure S3** Maximum residual water levels after removing tidal signal (combined volcanic  
82 meteotsunami (VMT) and oceanic tsunami). Expanded view of Fig. 1(a).

83

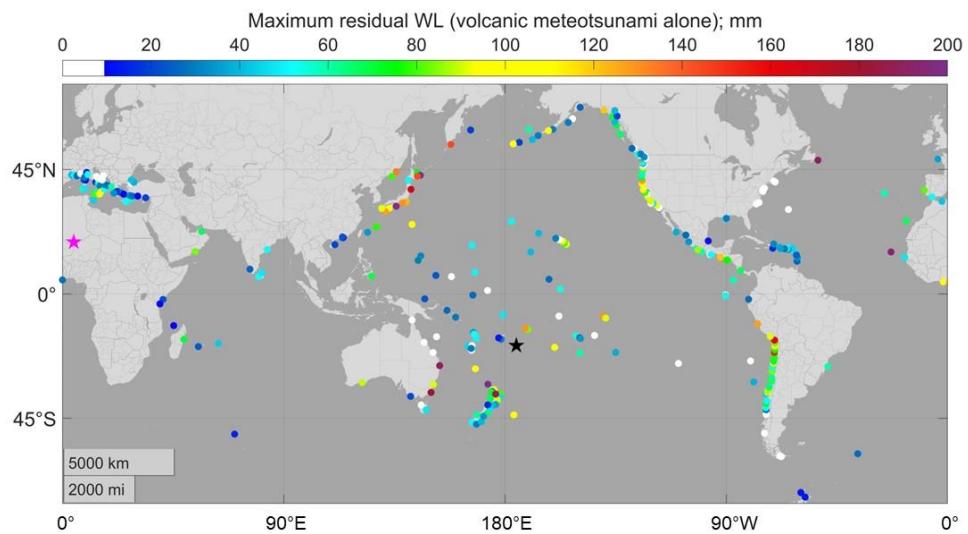

84

85 **Figure S4** Time of maximum overall residual water level (hours after eruption). Expanded view  
 86 of Fig. 1(b). White dots indicate the exact arrival time could not be clearly determined.

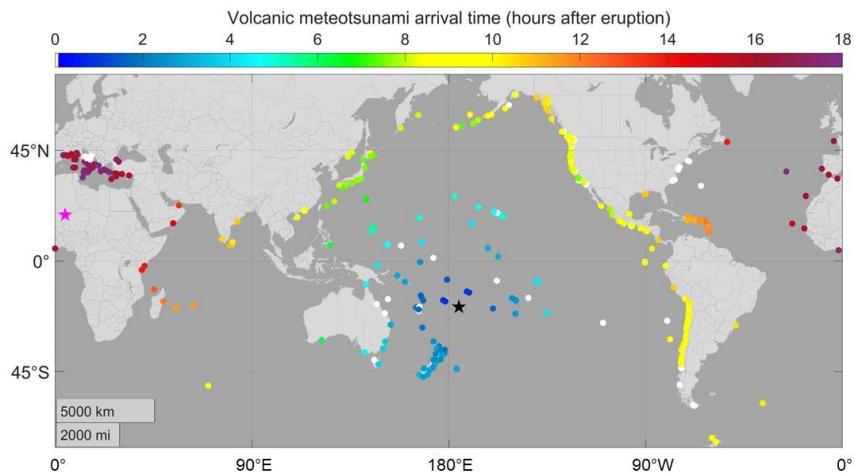

87

88

89

90 **Figure S5** Maximum residual water level due to VMT alone. Expanded view of Fig. 1(c).  
91

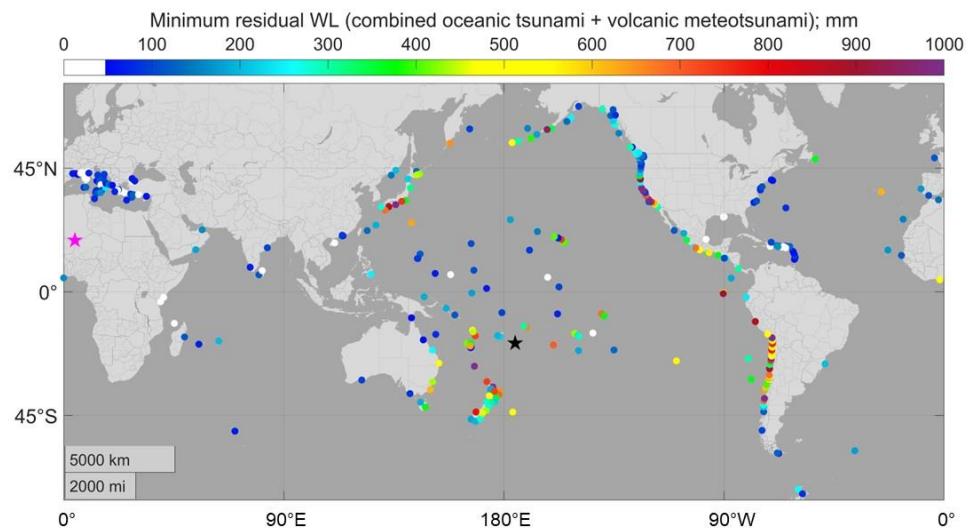

92

93 **Figure S6** Arrival time of the VMT as estimated from water level. Expanded view of Fig. 1(d).  
 94 White dots indicate exact arrival times could not be clearly determined.

95

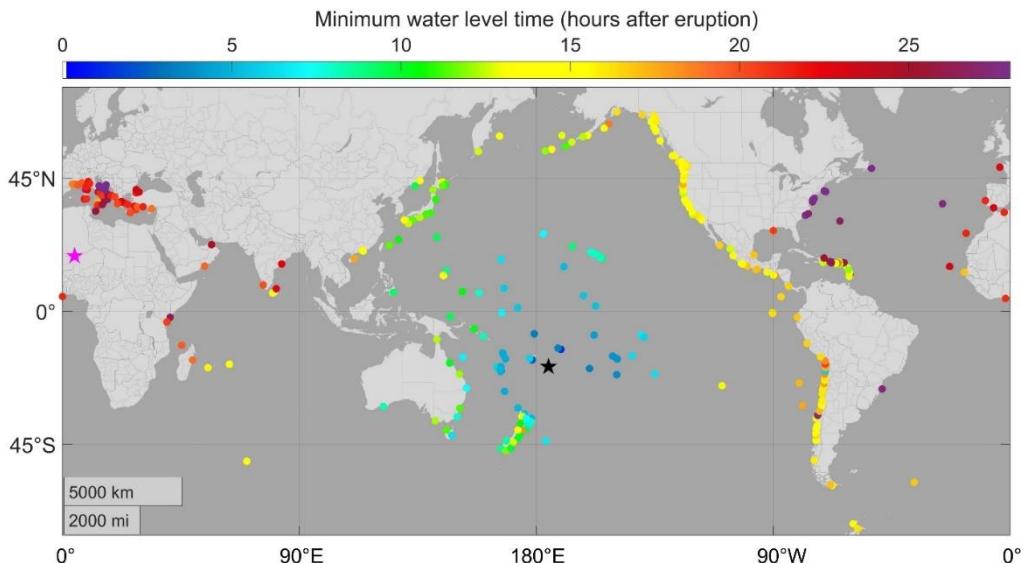

96

97

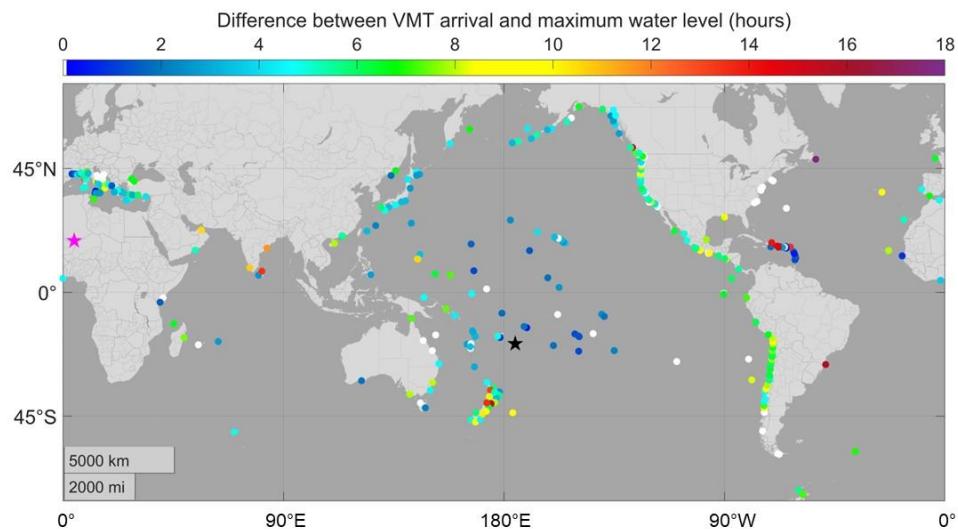

98 **Figure S7** Maximum negative (minimum) overall residual water levels (combined VMT and  
99 oceanic tsunami).

100

101

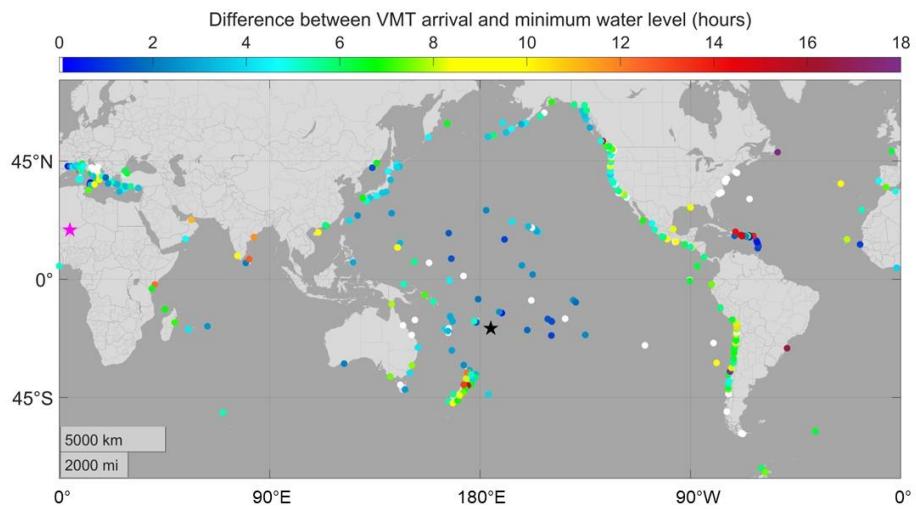

102 **Figure S8** Time of maximum negative (minimum) water level (hours after eruption). White dots  
103 indicate the exact VMT arrival time could not be clearly determined.

104

105 **Figure S9** Time difference between VMT arrival and time of overall maximum residual water  
106 level (hours). White dots indicate the exact VMT arrival time could not be clearly determined.

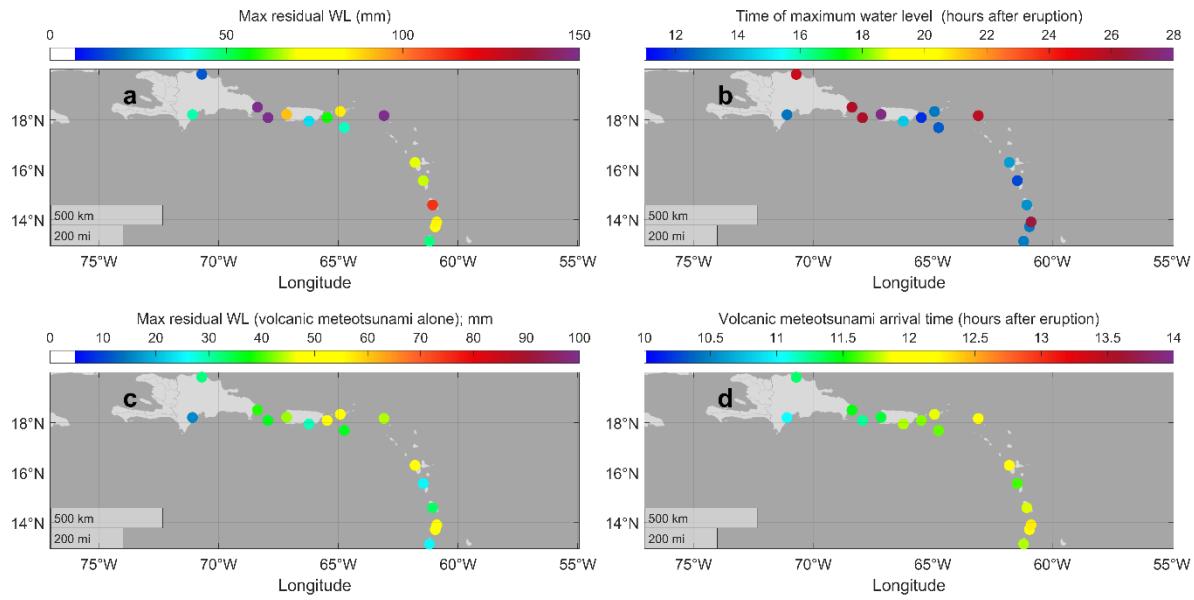

107

108

109 **Figure S10** Time difference between volcanic meteotsunami arrival  
110 and time of overall  
111 minimum water level (hours). White dots indicate the exact VMT arrival times could not be  
clearly determined.

112

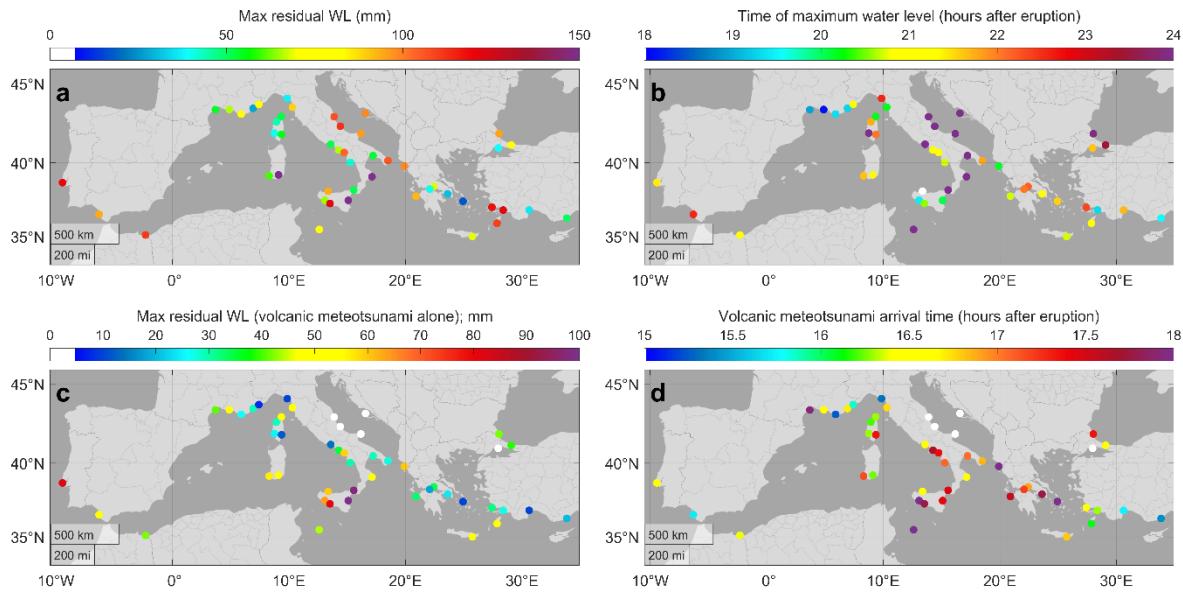

113

114 **Figure S11** Expanded view of the Caribbean Sea (same results as Fig. 1; different scales).

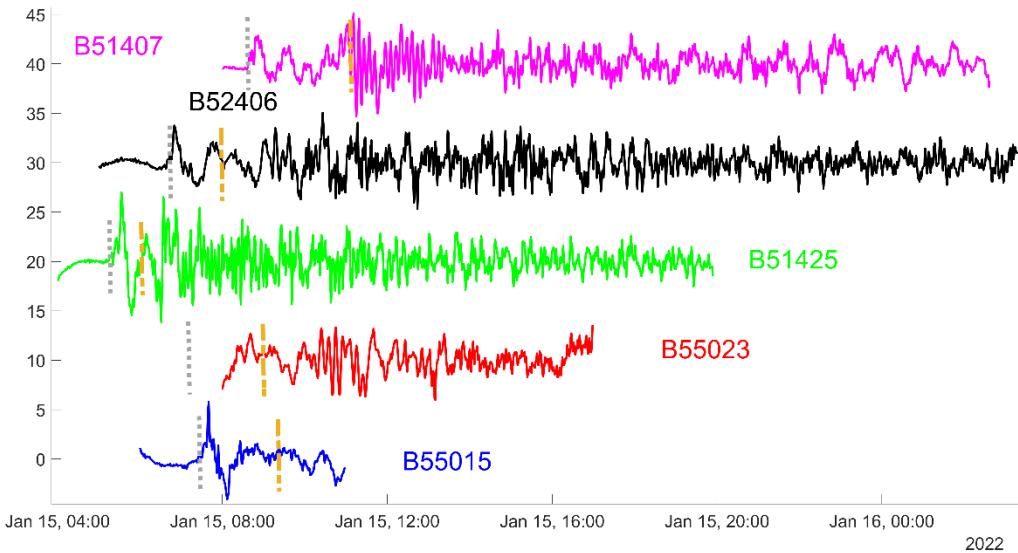

115

116

117

118 **Figure S12** Expanded view of the Mediterranean Sea (same results as Fig. 1; different scales).  
 119

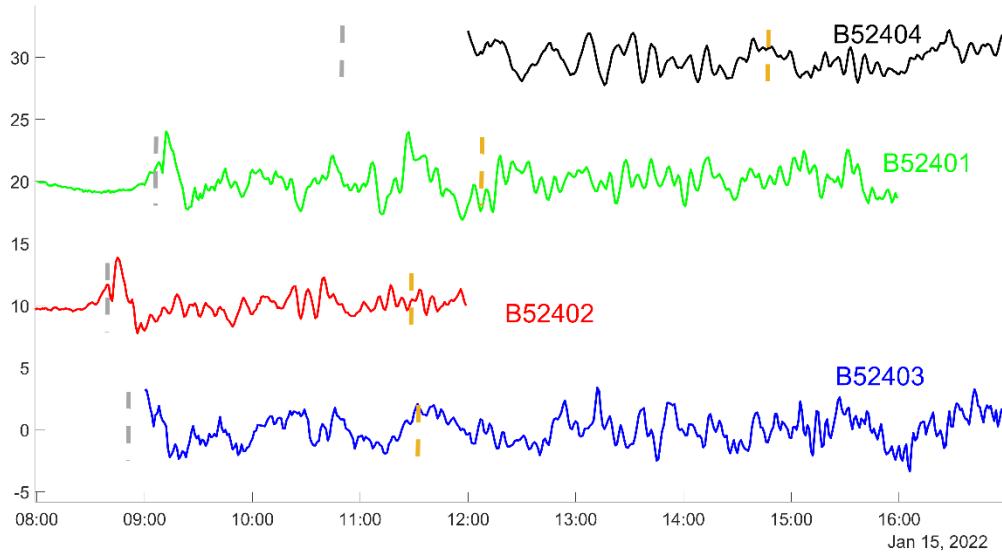

120

121 **Figure S13** WL response to the volcanic meteotsunami and oceanic tsunami at NDBC deep-  
 122 water buoys in the Central/Southwest Pacific. Buoys numbers are official NDBC designations;  
 123 details of each buoy can be found in Table S1, and locations are shown in Figure 2(a). Each buoy  
 124 is offset 10 cm vertically from each other. VMT arrivals are based on a theoretical travel time of  
 125 1115 km/hr<sup>-1</sup> as indicated by grey, dotted vertical lines, and oceanic tsunami arrivals are based  
 126 on an average travel time of 700 km/hr<sup>-1</sup> as indicated by orange, dash-dot vertical lines.

127

128

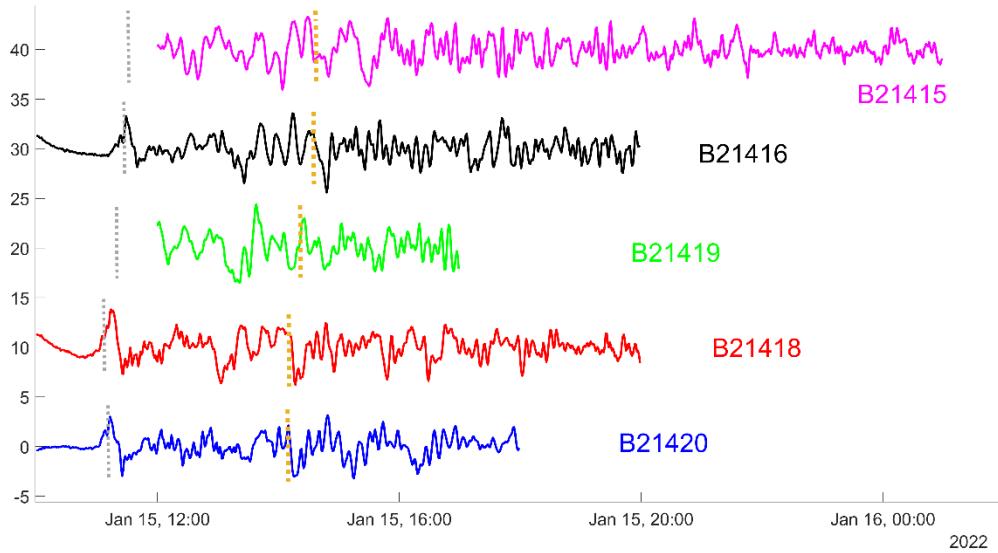

129

130 **Figure S14** WL response to the volcanic meteotsunami and oceanic tsunami at NDBC deep-  
 131 water buoys in the West Pacific. Buoys numbers are official NDBC designations; details of each  
 132 buoy can be found in Table S1, and locations are shown in Figure 2(a). Each buoy is offset 10  
 133 cm vertically from each other. VMT arrivals are based on a theoretical travel time of  $1115 \text{ km/hr}^{-1}$   
 134 as indicated by grey, dashed vertical lines, and oceanic tsunami arrivals are based on an average  
 135 travel time of  $700 \text{ km/hr}^{-1}$  as indicated by orange, dashed vertical lines.

136

137

138

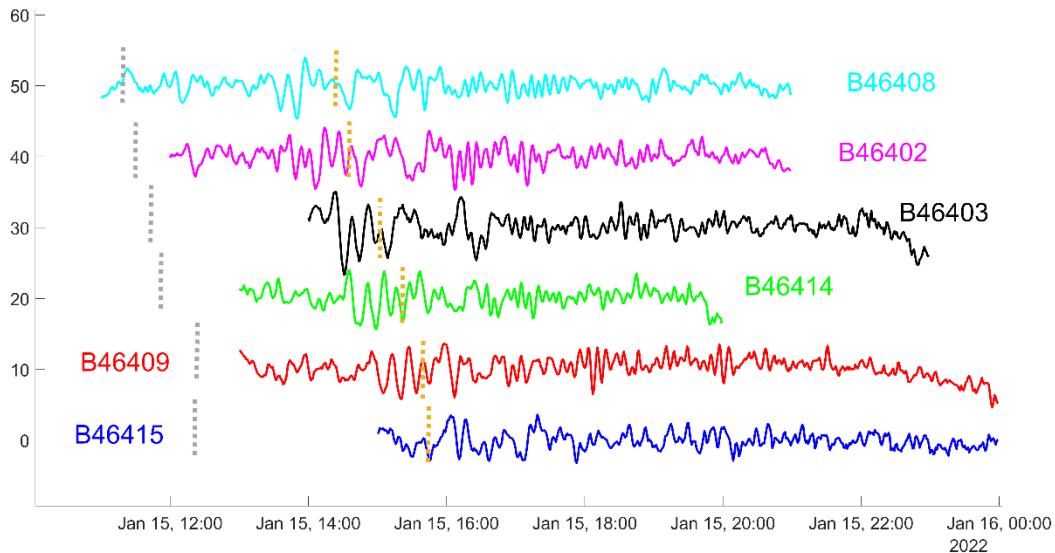

139

140 **Figure S15** WL response to the volcanic meteotsunami and oceanic tsunami at NDBC deep-  
 141 water buoys in the Northwest Pacific. Buoys numbers are official NDBC designations; details of  
 142 each buoy can be found in Table S1, and locations are shown in Figure 2(a). Each buoy is offset  
 143 10 cm vertically from each other. VMT arrivals are based on a theoretical travel time of 1115  
 144 km/hr<sup>-1</sup> as indicated by grey, dotted vertical lines, and oceanic tsunami arrivals are based on an  
 145 average travel time of 700 km/hr<sup>-1</sup> as indicated by orange, dotted vertical lines.

146

147

148

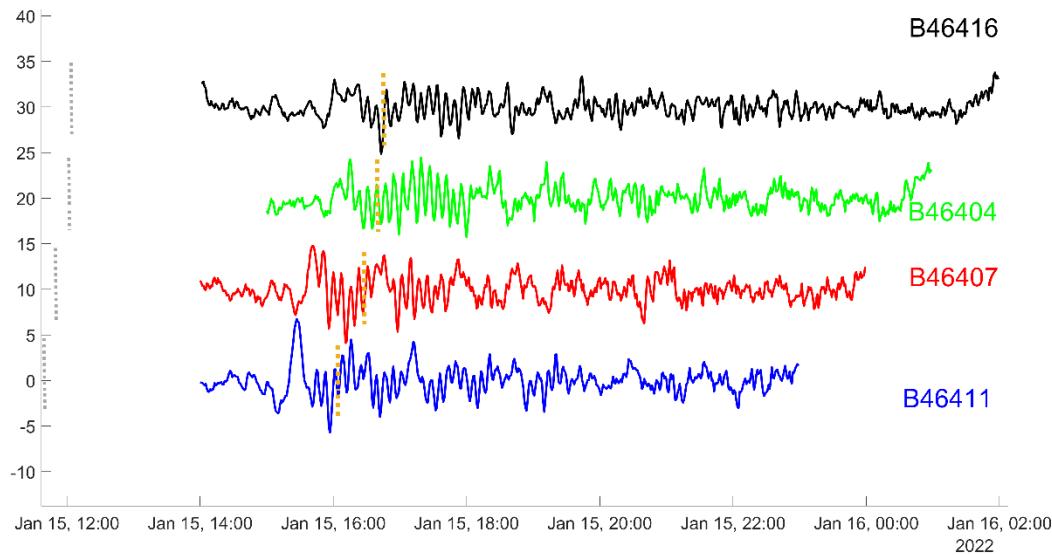

149

150 **Figure S16** WL response to the volcanic meteotsunami and oceanic tsunami at NDBC deep-  
 151 water buoys in the North Pacific. Buoys numbers are official NDBC designations; details of each  
 152 buoy can be found in Table S1, and locations are shown in Figure 2(a). Each buoy is offset 10  
 153 cm vertically from each other. VMT arrivals are based on a theoretical travel time of 1115 km/hr<sup>-1</sup>  
 154 as indicated by grey, dotted vertical lines, and oceanic tsunami arrivals are based on an average  
 155 travel time of 700 km/hr<sup>-1</sup> as indicated by orange, dotted vertical lines.

156

157

158

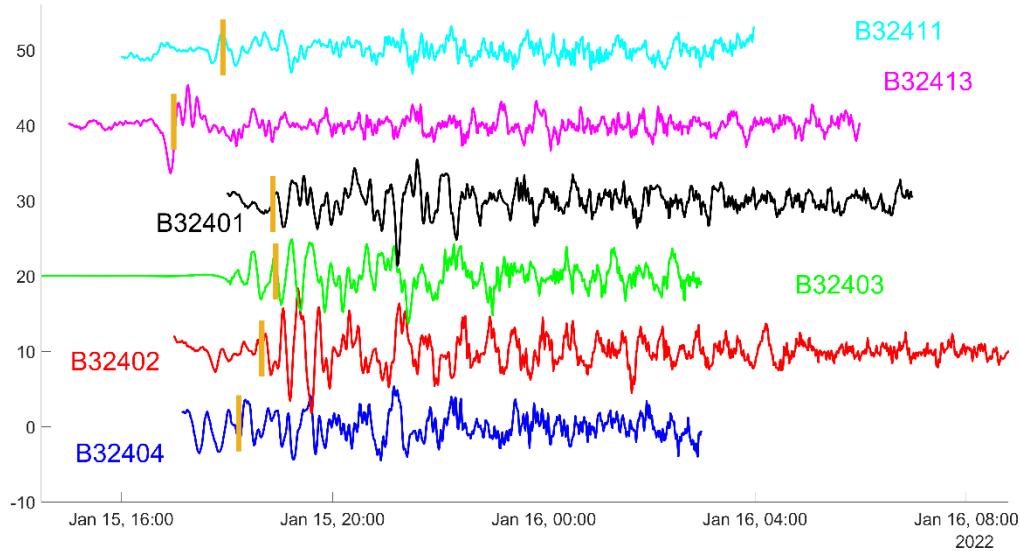

159

160 **Figure S17** WL response to the volcanic meteotsunami and oceanic tsunami at NDBC deep-  
 161 water buoys in the Northeast Pacific. Buoys numbers are official NDBC designations; details of  
 162 each buoy can be found in Table S1, and locations are shown in Figure 2(a). Each buoy is offset  
 163 10 cm vertically from each other. VMT arrivals are based on a theoretical travel time of 1115  
 164 km/hr<sup>-1</sup> as indicated by grey, dotted vertical lines, and oceanic tsunami arrivals are based on an  
 165 average travel time of 700 km/hr<sup>-1</sup> as indicated by orange, dotted vertical lines.

166

167

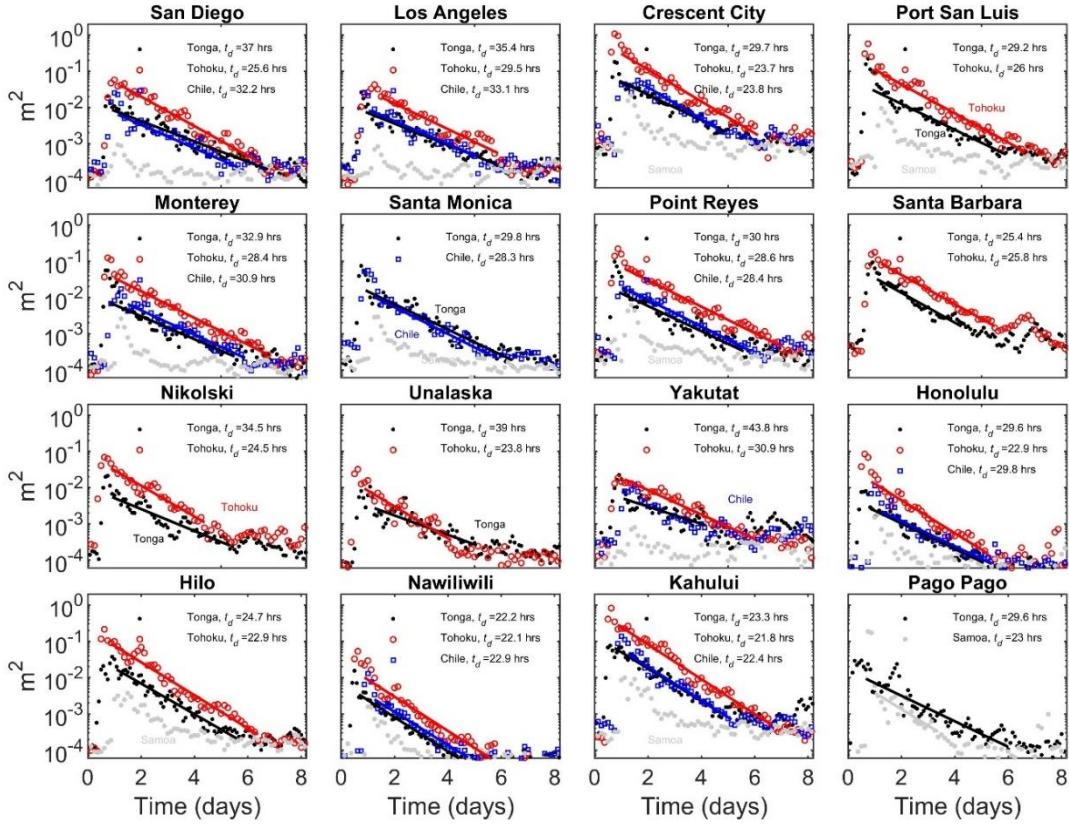

168

169

170 **Figure S18** WL response to the volcanic meteotsunami and oceanic tsunami at NDBC deep-  
 171 water buoys in the Southeast Pacific. Buoys numbers are official NDBC designations; details of  
 172 each buoy can be found in Table S1, and locations are shown in Figure 2(a). Each buoy is offset  
 173 10 cm vertically from each other. Oceanic tsunami arrivals are based on an average travel time of  
 174 700 km/hr<sup>-1</sup> as indicated by orange vertical lines. None of these stations recorded the VMT,  
 175 which arrived a few hours before the starting time axis of this plot.

176

177

178 **Figure S19** Individual comparisons of energy decay time scales at Northern Pacific locations for  
 179 the Tonga (2022), Chile (2010), Samoa (2009), and Tohoku (2011) tsunami events. Sixteen  
 180 locations are shown in California, Alaska, Hawaii, and Pago Pago. In all plots, the Tonga Event  
 181 is indicated by black markers, Tohoku by red, and Chile by blue. A line is fit to each spectral  
 182 energy decay curve and an e-folding time-decay estimated (see main text). Some locations did  
 183 not have data for one or two events. The Pago Pago plot at the bottom right only compares  
 184 Tonga to the 2009 Samoa Event (grey).

185 **Table S1** Stations used for analysis in this study (including tide gauges and deep-water buoys).  
 186 Given are station names/countries, latitude and longitude, distance from the Tonga volcano, data  
 187 source, and filename of each station used in the online repository. EC: European Commission;  
 188 IOC: Intergovernmental Oceanographic Commission; NOAA: National Oceanic and  
 189 Atmospheric Administration; LINZ: Land Information New Zealand; NIWA: National Institute  
 190 of Water and Atmospheric Research (NZ).

203      **Table S3** Inventory of “bad” stations where no tsunami could be clearly observed or was too  
 204      small to analyze, locations are shown in Supplementary Figure S1. Given are station names,  
 205      latitude/longitude, and status of gauge with reason for non-detection. Status categories and colors  
 206      used in Supplementary Figure S1 are: 1) good data with a small signal suggested, but too small  
 207      to analyze (dark blue); 2) good data, but uncertain results, which was either due to too much  
 208      noise, the presence of storms, or under-sampled data, i.e., 5-min or longer time resolution (light  
 209      blue); 3) instrumental errors (red); 4) missing data (black); and 5) good data, but no tsunami  
 210      signal detected (yellow).

213   **Table S4** Maximum water level parameters. Maximum level reached after the tsunami is given  
 214   (mm), along with the day and time of maximum water level, time between eruption and  
 215   maximum level (hours), and time difference between VMT arrival and maximum water level  
 216   (hours). A mean offset is removed from all results. Values of \*\* in the final column indicate that  
 217   the VMT arrival times were not determined.

218

<u>Station</u>	<u>Max WL (mm)</u>	<u>Max height day</u>	<u>Max height time (UTC)</u>	<u>Time after eruption (hours)</u>	<u>Time difference between max WL and VMT arrival (hours)</u>

221      **Table S5** First arrival of the volcanic meteotsunami wave estimated from water level records.  
 222      Arrival day and times, duration since eruption (hours), and residual water level of the VMT  
 223      (mm) are given. Entries of “\*\*” indicate that the first VMT wave could not be determined from  
 224      water level records. A mean offset is removed from all results.

225

228      **Table S6** Minimum water level parameters. The minimum level reached after the tsunami is  
 229      given (mm), along with the day and time of minimum water level, time between eruption and  
 230      minimum level (hours), and time difference between VMT arrival and minimum water level  
 231      (hours). A mean offset is removed from all results. Values of \*\* in the final column indicate that  
 232      the VMT arrival times were not determined.

233  
234

240  
 241

242   **Table S8**  $\beta$ -factor calculations. Station names are given, along with volcanic meteotsunami-  
 243 induced maximum residual water level (mm), air pressure gauge used, maximum air pressure at  
 244 VMT arrival (mb) and arrival time, and calculated  $\beta$ . Calculations are determined by the ratio of  
 245 residual VMT water level maximum to maximum air pressure.

246
