I think this is a very interesting paper. I just want to present some references for the lines 17-21 on page 779. I also think this new technique of deploying tags that measure the immediate environment of an animal is a very important tool to characterise a habitat. Maybe the authors should write a bit more about that as it is also an important part of GOOS today. Such tags are now also equipped with fluorometers in addition to the standard CTD sensors.
