Regarding Fig.7: it is impossible to see how much these 2 profiles differ from each other. If you want to keep all temperature scale, either increase the resolution of the picture and give those 2 profiles in different colors, or provide an inset picture with fine horizontal sampling.

Also page 12 line 6 "The level of agreement is striking..." Unappropriate statement for scientific paper. Please rephrase. It should be possible to judge level of agreement from Figures 5-7.
