

Interactive comment on “An empirical stochastic model of sea-surface temperature and surface wind over the Southern Ocean” by S. Kravtsov et al.

Anonymous Referee #2

Received and published: 2 October 2011

In my view, the paper is more of a report of the authors work, than a conclusive study of the relation between SST and SLW, as it was indicated in the abstract. The presentation is verbal, and it is hard for the readers to draw any clear conclusions by themselves. The model order is large and could doubt the generality of the findings. Note, for example, the comment on p. 27, l. 2-3, on the ambiguity of models.
