Received and published: 12 June 2018

The authors present a study of the physical-biological coupling of the coastal upwelling off Vietnam. They use in situ, remote sensing and model data. The model is validate with the in situ and remote sensing data, which gave some confident to its outputs. The MS is well written and present interesting results, concluding with a schematic interpretation of the processes related to the variability of primary productivity. Thus, it is my opinion that the MS should be accepted after minor revision taking into the account the comments I made directly in the PDF in annex.
