18 We thank both reviewers for the evaluation of our manuscript. In this document, all of their constructive
19 comments were answered thoroughly. The referees' comments are marked blue and our replies black.
20 The given line numbers of changed sentences are referring to the new lines in the revised manuscript.

Reviewer: 1, 24 Feb 2020

The manuscript discusses a novel way of desalinating marine samples for the determination of several low concentration organic compounds in that environment. The application of electrodialysis is investigated methodically, including the optimization of operational parameters and quantification of biases as well as a comparison to membrane dialysis. This work is very viable to help elucidate the composition and concentration of organics in marine samples and beyond.

However, the text is not always easy and clear to read, and some structural changes and clarifications are needed before publication. These are discussed in the comments below.

Authors: Thank you for your very constructive review. In order to improve the readability of our manuscript, we carefully read your comments and changed the text correspondingly.

Specific comments:

Lines 102-105: what are you basing this statement on? Is this based on preliminary own experiments? If so, can this be discussed further (in supplementary information perhaps)?

Authors: The mentioned phenomena (osmosis, electro-osmosis, water splitting, etc.) during electrodialysis had been subject to previous publications (Galama et al., 2014; Han et al., 2015). However, the impact of these phenomena on analytical quantifications has not been discussed yet in the literature. Here, we explicitly include the discussion of such phenomena in chapter 3.1 and 3.2 of this manuscript regarding the analysis of sugars in salty matrices. In order to make it clearer to the reader that these biases have already been mentioned by previous studies before, we added further information to the introduction. The changed text now reads: 'However, following biases, which have hitherto not been discussed in this analytical context, can occur during the application of ED and might falsify the determined concentration of the analytes in the sample. In contact with ion exchange membranes, the passive transport of water (*osmosis*) and solutes with a low molecular weight (*diffusion*), such as DFCHO, can occur triggered by a concentration gradient between the sample and concentration channels (Galama et al., 2014; Galier et al., 2012). Additionally, the active transport of charged molecules (*migration*) and water bound to ions in their hydration sphere (*electro-osmosis*) takes place by operating an electrical field (Galama et al., 2014; Han et al., 2015, 2017). While osmosis and electro-osmosis induce an unavoidable loss of water and hence of the total volume of the sample, diffusion and migration of the analytes result in a loss of analyzable molecules. Furthermore, water splitting and associated pH fluctuations have been reported, when a limiting current is exceeded during an ED desalination (Cowan, 1962; Martí-Calatayud et al., 2018; Ottosen et al., 2000; Vetter et al., 2007).' (new lines 102-113)

Line 123: at which concentration was the seawater prepared?

Authors: We used four different concentration resulting in salinities of 10, 20, 30 and 40 practical salinity units (PSU). The information about the concentrations is given in chapter 2.6, where we explain the concrete experimental set-up. Now we added this information to chapter 2.1 'Chemicals and materials' as well. The changed sentence now reads: 'Synthetic seawater samples were made from commercially available sea salts (Sigma) achieving four solutions with salinities of 10, 20, 30 and 40 practical salinity units (PSU). The salinity and the pH of water aliquots was measured by using a conductivity meter (pH/Cond 3320, WTW).' (new lines 134-135)

Line 149: why did you chose to work with a 16 g/L NaCl solution in the concentrate? The unit of ml/mL also seems wrong here.

Authors:

-16 g/L:

A concentration of 16 g NaCl/L in the concentrate circuit was originally chosen in order to have a good conductivity within the ED system and minimizing the impact of the osmotic transport, which could result

in a change of the DFCHO and DCCHO concentrations. Among other parameters, the effect of osmosis depends on the difference between the concentrations of solutes in the sample solution and the concentration circuit ($c_s - c_c$). In order to minimize the analytical error due to osmosis, we chose a concentration which is approximately in the middle between the concentrations of a typical seawater sample before (30-39 PSU) and after the desalination (0.2-0.4 PSU) for balancing the positive and negative contribution of osmosis on the total sample volume during a typical desalination. We originally included this issue in chapter 3.2 and think that this is a good place for this discussion. However, in the current version, we added a short explanation in the 'Experimental', in order to explain the used concentration. The changed text now reads: 'For maintaining the conductivity within the system and receiving the sea salt from the sample, the next compartment contained the concentration circuit, a 16 g·L⁻¹ NaCl solution (Merck). This concentration was chosen in order to minimize the osmotic water transfer as discussed below.' (new lines 161-163)

-unit:

Thanks, it was a typing mistake. We changed the sentence, which now reads: 'This solution was circulated at a rate of 60 mL·min⁻¹.' (new line 164)

Line 155-156: what do you mean by 'homogenized with a pipette during desalination'? This is not clear to me.-

Authors: In order to describe more clearly how homogenization was achieved, we rephrased the sentence, which now reads: 'The sample solution was homogenized during each desalination by drawing some liquid into a Pasteur pipette and draining it immediately back to the sample compartment.' (new lines 172-173)

What type of membranes were the end membranes?

Authors: We added this information to the main text, which now reads: 'The end membranes were cation exchange membranes with an increased chemical durability and an additional reinforcement in order to withstand the strong differential pressure within the ED system.' (new lines 165-167)

From Figure 1 it seems like a CEM was used at the anode side and an AEM was used at the cathode side, but this is not specified in the text.

Authors: You are right. We specified this in the main text. The changed text now reads: 'The functionalized anion exchange membrane (quaternary ammonium aliphatic polyether) and cation exchange membrane (sulfonated aromatic polyether) bordered this compartment on both sides. Depending on their chemical properties, the membranes allowed exclusively the migration of either positively or negatively charged ions. For that matter, the anion exchange membrane bordering the sample chamber was oriented to the anode and the cation exchange membrane to the cathode.' (new lines 155-160)

Line 221: what are the set points 25V and 0.6A based on? This is a very high voltage which can cause water splitting. Did you see any pH fluctuations? This question is later answered in part 3.1, I suggest to already make a reference to this part and/or include the protocol for the parameter optimization in M&M instead of results.-

Authors:

- set points 25V and 0.6A:

The set points of maximal voltage and maximal current was based on technical information given by the producer of the PCCell Micro Bench ED system. Furthermore, these parameters were adapted to our application in order to achieve a fast desalination, but avoiding scaling of membranes caused by pH fluctuations due to water splitting as it might occur during the exceedance of a limiting electrical current (as it was already described by Vetter et al., 2007) We discussed this topic in chapter 3.1 of our manuscript.

- high voltage can cause water splitting

To our knowledge, the occurrence of water splitting during an ED desalination is related to the applied current and not directly to the voltage. E.g. Vetter et al. (2007) applied a maximal voltage of 250 V in their ED device while caring about the applied current carefully. They did not observe pH fluctuations due to water splitting.

- pH fluctuations:

We observed strong pH fluctuations when the current was set too high during ED desalination. We discussed this phenomenon in chapter 3.1 of our manuscript.

- adding reference to M&M:

In order to improve the understandability of the used ED parameters to the reader already in this part of the manuscript, we added the information to the chapter '2.3 The ED system', where we mention the used voltage and current for the first time. The added text reads: 'The maximal current was set on 0.6 A in order to perform a fast desalination, but also to avoid a scaling of the membranes due to water splitting and is discussed more in detail below.' (new lines 176-177)

The same comments holds for part 3.2. Both this part and the previous part contains information that is not considered results or discussion and should thus be included in the introduction part (e.g. general explanation of (electro)osmotic water transport and why a concentration of 16 g/L was chosen in the concentrate).

Authors:

- (Electro)-osmotic transport

According to the referees' suggestion, we restructured the manuscript by taking the general explanation of (electro)osmotic water transport, diffusion and migration and water splitting processes from the results into the introduction. The changed introduction now reads: 'However, following biases, which have hitherto not been discussed in this analytical context, can occur during the application of ED and might falsify the determined concentration of the analytes in the sample. In contact with ion exchange membranes, the passive transport of water (*osmosis*) and solutes with a low molecular weight (*diffusion*), such as DFCHO, can occur triggered by a concentration gradient between the sample and concentration channels (Galama et al., 2014; Galier et al., 2012). Additionally, the active transport of charged molecules (*migration*) and water bound to ions in their hydration sphere (*electro-osmosis*) takes place by operating an electrical field (Galama et al., 2014; Han et al., 2015, 2017). While osmosis and electro-osmosis induce an unavoidable loss of water and hence of the total volume of the sample, diffusion and migration of the analytes result in a loss of analyzable molecules. Furthermore, water splitting and associated pH fluctuations have been reported, when a limiting current is exceeded during an ED desalination (Cowan, 1962; Martí-Calatayud et al., 2018; Ottosen et al., 2000; Vetter et al., 2007).' (new lines 102-113)

- 16 g/L

As already mentioned before, we added a short explanation in the 'Experimental', in order to explain the used concentration. The changed text now reads: 'For maintaining the conductivity within the system and receiving the sea salt from the sample, the next compartment contained the concentration circuit, a 16 g·L⁻¹ NaCl solution (Merck). This concentration was chosen in order to minimize the osmotic water transfer as discussed below.' (new lines 161-163)

Line 319: it is not clear how you estimated this 3% and how you distinguished this osmotic water transport from the overwhelming electro-osmotic water transport. Is this from Figure 3? Because you can't really distinguish between the two modes of water transport during the first part of your desalination. The contribution of osmosis also changes in size and direction throughout the experiment as the salt concentrations change. Is it not simply enough to determine the final volumes in each compartment to account for concentration/dilution of your sample due to water transport?

Authors:

We estimated this maximal 3% based on the observed osmotic water loss in the end of the desalination when the concentration difference of salt between sample and concentration circuit was the highest and no electro-osmotic water transport occurred simultaneously. However, you are right by saying that the size and direction of osmosis is changing throughout the experiment and we cannot distinguish between the two modes of water transport during the first part of our desalination. The real water loss by osmosis should be definitively lower than 3%. Because of this, we followed the recommendation and eliminated this information from the main text.

Line 351-352: transport of organics in presence of high salt concentrations is expected to be minimal, as demonstrated in a paper by Vanoppen et al. (2015).DOI10.1021/es504389q

Authors: This reference gives a good comparison for the recovery rates of neutral organics and the neutral monosaccharides which were presented in this study. We included this reference by adding this sentence, which reads: 'This is in agreement with Vanoppen et al. (2015) who concluded that diffusion and affinity for the membrane are the main drivers for losses of uncharged, low-molecular organics during a desalination using an ED system.' (new lines 360-362)

Line 366-368: this statement is odd here and would be expected more at the end of the introduction.

Authors: We removed this statement from the 'Results and Discussion' chapter and moved it to the introduction. Now the new end of the introduction reads: 'This method with a low need of consumables allows the analysis of monosaccharides with (CCHO) and without hydrolysis (DFCHO), including the possible determination of free amino sugars and free uronic acids. This developed technique was applied to analyze a diverse set of carbohydrates in different kinds of ambient seawater samples.' (new lines 117-120)

Figure 4: describe the difference between the full and dotted line in the caption. Please discuss the implications of the dotted line in the discussion. Is this a good quantification of the difference between both methods?

Authors:

-caption:

We added the meaning of the full and the dotted line in the caption of Figure 4. The added line reads: 'The full line represents the line of equality. The dotted line represents the regression line between the data of both methods.'

-discussion in the main text:

We added a short discussion about the implication of the dotted line. The added sentence reads: 'The similarity of the equality line and the regression line ($R^2=0.89$) using all sugar data indicate a good overall agreement between both methods.' (new lines 399-400)

-good quantification?:

There exist several statistical methods in order to evaluate the comparability of two methods. You are right by asking if a scatter plot and a regression line (Figure 4) between both method's values is the best solution, since it suffers certain weaknesses. Therefore, we considered using a Bland-Altman plot (as it was recommended for a method comparison by van Stralen et al., 2008). It is a scatter plot in which the mathematical difference between the paired measurements is plotted against their average. Usually

additional lines represent the mean and the mean $\pm$ 2-standard deviations in order to achieve limits of agreement. The limits of agreement always need to be examined in respect to the scale of the x-axis. A Bland-Altman plot for our data is shown below. Overestimations of rhamnose, arabinose and underestimations of glucosamine can be seen in the Bland-Altman plot, as it is evident in Figure 4 of the manuscript as well. However, we found that the Bland-Altman plot appeared not suitable for the presentation of our data, since its interpretation is not intuitive and needs many additional explanations. The most important observations are described in the main text in any case. Considering the pros and cons, we decided that the correlation plot, together with the explanations in the text, might be an appropriate way to represent our method comparison.

Technical corrections:

Generally, I propose to introduce the abbreviation ED for electro-dialysis and using it throughout the manuscript.

Authors: We introduced the abbreviation 'ED' for 'electro-dialysis'/'electrodialysis' throughout the manuscript.

Line 98, replace ',' with 'and' (and there are of course many more examples of ED application)

Authors: In order to express that the mentioned examples only represent a selection of ED applications, we added the term 'amongst others'. The sentence now reads: 'Amongst others, ED is being used for the desalination of salty water to generate potable water and the denitrification of wastewater and soil remediation...' (new lines 97-98)

Line 199: sometimes you use 'electro-dialysis' and sometimes 'electrodialysis'. The latter is more frequently used and you can introduce the abbreviation as suggested before.

Authors: As already suggested before, we introduced the abbreviation 'ED' for 'electro-dialysis'/'electrodialysis' throughout the manuscript.

Line 210: 'slide'= 'slight'

Authors: We replaced 'slide modifications' with 'slight modifications'. (new line 226)

Reviewer: 2, 28 Apr 2020

This is a detailed and thorough analytical development paper applied to a number of matrices and tested using marine samples. The authors have managed to achieve sensitive detection limits for a challenging analysis and the paper is suitable for publication with minor revision. I have detailed the changes needed below:

Authors: Thank you. Based on your very useful comments, we performed following changes in the manuscript.

DFCHO and CCHO are not obvious abbreviations; are these accepted forms?

Authors: We agree that DFCHO and CCHO are not obvious abbreviations. We assume that CHO is originally derived from the aldehyde group as an important structural element of carbohydrates. However, among others, these abbreviations are frequently used within the marine chemistry community (e.g. in Borchard and Engel, 2015; Engel and Händel, 2011; Jugnia et al., 2006; Richardot et al., 1999; Tranvik and Jørgensen, 1995). Therefore, we prefer to keep these abbreviations.

L13. 'dissolved free'; should also be DCCHO in that case.

Authors: We replaced 'free (DFCHO) and combined monosaccharides (CCHO)' with 'dissolved free (DFCHO) and dissolved combined carbohydrates (DCCHO)' (new lines 13-14). Furthermore, we replaced 'CCHO' with 'DCCHO' throughout the manuscript. Additionally, we added the sentence, which reads: 'In aquatic environments, CCHO either appear in a particulate (PCCHO) or dissolved form (DCCHO).' (new lines 40-41) Furthermore, we replaced 'Rather, we recommend ED only for the application to filtered samples (dissolved compounds), while particulate organic matter might be better analyzed from filters after filtration.' with 'Rather, we recommend ED only for the application to filtered samples (DCCHO), while PCCHO might be better analyzed from filters after filtration.' (new lines 392-393)

L20. Delete 'real'.

Authors: We deleted 'real'. The new sentence now reads: 'The applicability of this method for the analysis of DCCHO was evaluated with standard solution and seawater samples compared with another established desalination method using membrane dialysis.' (new lines 19-21)

L45. 'with' not 'to'.

Authors: The word 'to' was replaced with 'with'. The new sentence now reads: 'Furthermore, an elevated release of polysaccharides by phytoplankton, mostly of gelatinous nature, has been associated with stress situations, such as a deficiency of nutrients, freezing or fluctuating water potential....' (new lines 45-47)

L50. 'recent' not 'latest'.

Authors: We replaced 'a latest study' with 'a recent study'.

L57. Analogous to DFCC and DCAA?

Authors: We believe that the reviewer was referring to DFAA (dissolved free amino acids) and DCAA (dissolved combined amino acids). It is true that DFAA and DFCHO in seawater are mostly found in lower concentrations than their macromolecular equivalents (DCAA/DCCHO). Previous publication explained this finding with marine microbes processing these free sugars and amino acids with a very high turnover rate. We added this information to our manuscript, which now reads: 'DFCHO are mostly found in lower concentrations than DCCHO, since marine microbes utilize them with high turnover rates (Engbrodt, 2001; Engel and Händel, 2011; Ittekkot et al., 1981; Thornton et al., 2016) as it has been reported for amino acids analogously as well (Kuznetsova and Lee, 2002).' (new lines 57-59)

L68. 'oceanic environments' is more appropriate.

Authors: We replaced 'maritime regions' with 'marine environments'. (new line 68)

L74. kinds

Authors: We replaced 'with different kind of chromatographic methods' with 'with 'different kinds of chromatographic methods'. (new line 74)

L75. gas chromatography

Authors: We replaced 'gas chromatograph' with 'gas chromatography'. (new line 75)

L76. How is it labour intensive; give brief details?

Authors: There are several ways to derivatize sugars depending on the applied chromatographic analysis, requiring the use of toxic chemicals, robust lab parameters and internal standards. Derivatization is not needed when HPAEC-PAD is applied. However, we came to the conclusion that our use of the word 'labour intensive' is our subjective opinion and possibly misleading. Since this word is not important for understanding the text, we decided to delete it and rephrase the sentence. We replaced 'These methods require a quite difficult sample preparation, including a labor intensive derivatization step' with 'These methods require a prior derivatization in order to enable the chromatographic separation and detectability of these carbohydrates (Panagiotopoulos and Sempéré, 2005)'. (new lines 75-77)

L81. The ‘high ionic strength/content of seawatersamples’ is better.

Authors: We replaced ‘the presence of sea salt in seawater samples’ with ‘the high ionic content in seawater samples’ (new line 81)

L107. Related saline samples; what are they?

Authors: We agree that the term ‘related saline samples’ is not precise. For being more concrete, we added the examples ice cores and brine from Arctic sea ice. The new sentence now reads: ‘Within the present study, a novel protocol for the desalination of seawater samples and other saline samples (e.g. ice cores and brine from Arctic sea ice), applying electro-dialysis and HPAEC-PAD is presented, accounting for the described biases.’ (new line 115-117)

L116. Resistivity,not conductivity.

Authors: We replaced ‘conductivity’ with ‘resistivity’. (new line 127)

L117. How long were items soaked in 10 % HCl?

Authors: The plastic items were rinsed with 10% HCl three times. We added this information to the main text, which now reads: ‘All plastic equipment was first rinsed with 10% HCl solution for three times and then washed with ultrapure water another three times.’ (new lines128-129)

L123. ‘from’ not ‘to’

Authors: We replaced ‘Synthetic seawater samples were made of commercially available sea salts (Sigma)’ with ‘Synthetic seawater samples were made from commercially available sea salts (Sigma)’. (new lines 134-135)

L129. Delete ‘real’

Authors: Done. We applied this change throughout the manuscript.

L131. Add ‘sampling campaigns; delete’of our department’

Authors: We changed this sentence, which now reads: ‘These saline samples were collected during different sampling campaigns and stored at -20 °C.’ (new lines 147-148)

and addany details to acknowledgements.

Authors: Additional details about the sampling campaigns, such as locations and dates, are given in Table 1. Furthermore, we added a sentence to the acknowledgments: ‘We thank for the opportunities to use aqueous samples from various sampling campaigns in order to develop the method presented here.’ (new lines 497-498)

371 **L132. Delete 'kept'.**

372 Authors: Done. The new sentence now reads: 'These saline samples were collected during different
373 sampling campaigns and stored at -20 °C' (new lines 147-148)

374

375 **L143. mL ; change throughout.**

376 Authors: We replaced 'ml' with 'mL' throughout the manuscript. Furthermore, we replaced 'µl' with 'µL'
377 throughout the manuscript.

378

379 **L149. I presume this is 60 mL.min⁻¹ ; space before 'Two'**

380 Authors: Yes, thank you. This was a typing mistake. The new sentence now reads: 'This solution was
381 circulated at a rate of 60 mL·min⁻¹. Two end...'(new lines 163-164)

382

383 **L150. 'compartment' or 'section' 'containing' the electrodes.**

384 Authors: We replaced 'the third department including the electrodes' with 'the third compartment
385 containing the electrodes'. (new line 165)

386

387 **L152. 'made of' stainless steel.**

388 Authors: We replaced the word 'based on' with 'made of'. The new sentence reads: 'The MMO cathode
389 was made of stainless steel.' (new lines 168-169)

390 **L153. (e.g. to end of sentence)**

391 We replaced 'for avoiding unwanted redox reactions, e.g. the generation of corrosive elemental chlorine
392 from chloride.' with 'for avoiding unwanted redox reactions (e.g. the generation of corrosive elemental
393 chlorine from chloride).' (new lines 170-171)

394 **L155-156. Explain more clearly how homogenisation was achieved.**

395 Authors: In order to describe more clearly how homogenization was achieved, we rephrased the sentence,
396 which now reads: 'The sample solution was homogenized during each desalination by drawing some liquid
397 into a Pasteur pipette and draining it immediately back to the sample compartment.' (new lines 172-173)

398 **L156. Renewed how often (based on number of samples)?**

399 Authors: We renewed these solutions after every tenth desalination. The new text now reads: 'The
400 electrolyte and the concentration solutions were renewed after every tenth desalination.' (new line 174)

401

402 **L163. 'filled with' or similar**

403 Authors: We replaced 'exposed to' with 'filled with'. (new line 182)

404

405 **L171. Did the guard and analytical columns have the same packing (different codes given)?**

406 Authors: To our knowledge, the guard and analytical column do have the same packing. The only difference
407 between these both columns is their length. Therefore, the given code for both columns is almost identical
408 with 'Dionex CarboPac PA20 analytical column (3x150mm)' and 'Dionex CarboPac PA20 guard column
409 (3x30mm)'. However, we missed writing 'PA' in 'Dionex CarboPac PA20 analytical column (3x150mm)'.
410 This was corrected now.

411 **L172. What was maintained at 30 °C, and how?**

412 Authors: The analytical column and guard column were permanently maintained at 30 °C by keeping them
413 in a column oven. In order to make this clearer to the reader, we rephrased the sentence, which now
414 reads: 'Several neutral monosaccharides, amino sugars and uronic acids were separated on a Dionex
415 CarboPac PA20 analytical column (3x150mm) combined with a Dionex CarboPac PA20 guard column
416 (3x30mm). The column oven temperature was maintained at 30 °C.' (new lines 189-191)

417

418 **L173. Adaptation of Meyer et al. (2008)**

419 Authors: We replaced 'an adaption to the elution by (Meyer et al., 2008).' with 'an adaption of Meyer et
420 al. (2008).' (new lines 192-193)

421 **L174. 'were eluted in 4 mM NaOH solution'.**

422 Authors: We rephrased the sentence, which now reads: 'Neutral and amino sugars were eluted in 4 mM
423 NaOH within the first 19 min.' (new line 193)

424

425 **L175. Were they contaminants?**

426 Authors: Sugar acids are not contaminants, but interesting analytes that we want to quantify. These sugar
427 acids elute from the analytical column when sodium acetate is added to the eluent, since they interact
428 strongly with the stationary phase. At the same time, contaminants are flushed from the column as well,
429 when sodium acetate is added. In order to improve the understandability to the reader, we rephrased the
430 sentence, which now reads: 'By adding sodium acetate, sugar acids eluted. At the same time, organic and
431 inorganic contaminants were flushed from the column.' (new lines 193-195)

432

433 **L176. 'the remaining.... Equilibrated with 4 mM NaOH solution.**

434 Authors: We added the word 'the', and replaced 'at' with 'with'. The sentence now reads: 'After the
435 removal of the remaining acetate by 250 mM NaOH, the system was equilibrated with 4 mM NaOH for the
436 next sample injection.' (new lines 195-196)

437

438

L179. 'in' not 'asa'

Authors: 'As a duplicate' was replaced with 'in duplicate'. Furthermore, we replaced 'as triplicate' with 'in triplicate' throughout the manuscript.

L180. 'ranged from 2-12 nM'

Authors: We replaced 'were ranging between 2-12 nM' with 'ranged from 2-12 nM'. (new line 199)

L181. with reported data (refs)

Authors: We replaced 'in good agreement with literature' with 'in good agreement with reported data'. (new line 200)

L183. resistivity <18.2....

Authors: We changed 'conductivity' to 'resistivity'. (new line 202) Thank you for pointing on this oversight.

L193. Do you know how the pH changed with each change in the gradientprofile?

Authors: An integrated pH reference electrode measures the pH, which is displayed online. We observed a constant pH of 12.0 from 0 min to 19 min. By adding eluent C from 19 min to 35 min, the pH continuously raised until reaching a pH=13. Setting eluent A on 100% from 35 min to 44 min resulted into a permanent increase of pH until 13.5. Setting all eluents on their initial concentrations caused a slow adaption to pH=12.0 from 44 min to 78 min for the next injection. However, we did not add this information to the manuscript, since we don't believe that it has an important significance for the paper

L198. 4 oC; insert space between numbers and units through the paper.

Authors: We inserted a space between numbers and '°C' throughout the manuscript.

L199. 'at the end'.

Authors: We changed 'in the end' to 'at the end' throughout the manuscript.

L202. 'of expected DFCHO concentrations in seawater'.

Authors: We replaced 'A concentration step using a vacuum concentrator (MiVac) at 55 °C allowed the detection of low concentrated DFCHO, as it occurs in most seawater samples.' with 'A concentration step using a vacuum concentrator (MiVac) at 55 °C allowed the detection of expected DFCHO concentrations in seawater.' (new lines 219-220)

472 **L204.Weighed; change throughout.**

473 Authors: 'Weighted' was replaced with 'weighed' throughout the manuscript.

474

475 **L205. Delete 'remaining'.**

476 Authors: Done. The changed sentence now reads: 'After reaching a volume of less than approximately
477 600 µl,...'.(new lines 221-222)

478

479 **L208. 'in' duplicate**

480 Authors: 'as duplicate' was replaced with 'in duplicate' throughout the manuscript.

481

482 **L223.solutions**

483 Authors: 'solution' was replaced with 'solutions'.(new line 239)

484

485 **L224. 'repeated in triplicate for four.....'; delete 'and as triplicate for eachtime'.**

486 Authors: We rephrased this sentence, which now reads: 'These measurements were repeated in triplicate
487 for four different sea salt solutions (10, 20, 30 and 40 PSU).'(new lines 239-240)

488

489 **L234. Replace 'as well with' by 'and'; rmov e comma after membranes.**

490 Authors: We replaced 'as well with' with 'and'. We removed the comma after 'membranes. The revised
491 sentence now reads: 'In order to account for possible wasting phenomena, repetitions were performed
492 with new membranes and membranes which already had been used for some time before.' (new lines
493 249-251)

494

495 **L248.The samples can't be neutralised by evaporation; clarify this text.**

496 Authors: One crucial step for the sample treatment is the neutralization of the sample after acid hydrolysis.
497 However, the neutralization of acids by the addition of a base (e.g. NaOH) will introduce new ions to the
498 sample, which disturb the analysis at HPAEC-PAD. Hence, a neutralization using a base appears quite
499 pointless after a prior desalination.

500 The advantage of using hydrochloric acid is the volatility of HCl, when the contained water molecules
501 evaporate at the same time. By removing HCl from the system by evaporation, a neutralization can actually
502 be achieved. Amongst other references, this procedure has been already described by Engel and Händel
503 (2011) and Panagiotopoulos and Sempéré (2005).

504 In order to make this approach clearer to the reader, we rephrased the sentence, which now reads:
505 'Aliquots of 1 mL with and without desalinations were hydrolyzed (HCl 0.8 M, 100 °C, 20 h) and neutralized
506 by evaporation of the volatile liquid..' (new lines 262-263)

507

508 **L259-260. 'requires prior removal of sea salt'.**

509 Authors: We removed 'requires a prior removal of disturbing sea salt.' with 'requires prior removal of sea
510 salt.' (new lines 275-276)

511

512 **L283. 'Large pH increase'**

513 Authors: We replaced 'strong rise of the pH' with 'large pH increase'. (new line 298)

514

515 **L301. What is hydrated water; is it the hydronium ion?**

516 Authors: We actually meant neutral water, which is bound to ions in their hydration sphere. We corrected
517 the sentence, which now reads: 'By operating an electrical field, the active transport of charged molecules
518 (*migration*) and water bound to ions in a hydration sphere (*electro-osmosis*) takes place...' (new lines 107-
519 108)

520

521 **L330. 'of 87 %'**

522 Authors: We agree that the used preposition 'onto 87 %' is wrong. In order to give a unmistakable phrasing,
523 we changed the sentence which now reads: 'a maximal reduction of the sample volume by 13 % due to
524 electro-osmosis was expected' (new lines 333-334)

525

526 **L339. 'a constant rate'**

527 Authors: We added the word 'a'. The new sentence now reads: 'Once the sea salt is removed, osmotic
528 water transfer remains at a constant rate of approximately 0.1%·min⁻¹. (new lines 342-343)

529

530 **L342. 'at the end'**

531 Authors: We replaced 'in the end' with 'at the end'. (new line 346)

532

533 **L366. '89 % recovered at pH 1.5'**

534 Authors: We replaced '...with the exception of fructose, which was recovered with 89% at pH 1.5,...' with
535 '...with the exception of fructose, which was 89% recovered at pH 1.5,...'. (new lines 371-372)

536

537 **L381. 'it does not leave'**

538 Authors: We added the word 'it'. The new sentence now reads: '...and it does not leave the sample
539 solution'. (new line 382)

540

541 **L383. Replace 'worse' with 'lower'.**

542 Authors: We replaced 'in much worse recoveries' with 'in much lower recoveries'. (new line 384)

543

544 **L387. Replace 'gadget' with 'system' or 'apparatus'.**

545 Authors: We replaced 'gadget' with 'apparatus'. (new line 387)

546

547 **L392. 'to filtered samples'**

548 Authors: We replaced 'at filtered samples' with 'to filtered samples'. (new line 392)

549

550 **L396. 'were performed'**

551 Authors: We replaced 'studies have been performed' with 'studies were performed'. (new lines 396-397)

552

553 **L398. 'method presented here'**

554 Authors: We replaced 'the here presented method' with 'the method presented here'. (new line 398)

555

556 **L416. 'been reported'; delete 'givenonly'**

557 Authors: We deleted the word 'given only' and added 'been reported'. The changed sentence now reads:
558 'Therefore, xylose and mannose have been reported as sum concentrations frequently.' (new line 416-
559 417)

560

561 **L479. 'of' not 'with'**

562 Authors: We replaced 'lower concentrations with 11-118 nM' with 'lower concentrations of 11-118 nM'.
563 (new line 479)

564

565 **L484. research**

566 Authors: We replaced 'further researches' with 'further research'. (new line 486)

567

Additional changes

We replaced 'combined to' with 'combined with' (title).

We added 'hexoses, pentoses' to line 39.
